

ALTERNATIVE ENERGY and ALTERNATIVE HOME BUILDING TOUR

Saturday, October 28, 2006
8:00 AM – 4:30 PM

Are you interested in finding cleaner, less expensive sources of energy to power your home? Are you considering building a home and want to see some examples of non-traditional building methods? Then sign up for our 2006 Alternative Energy and Home Building Tour on October 28th.

This year the tour will include homes built with alternative building materials such as insulated cinder blocks, structurally integrated panels, tires, straw bales, and a geodome. Most of these homes supply all of their electrical power using wind and sun, with a generator for backup. They are using various methods of deep well pumping (ie. Solar jackpump, gasoline-powered jackpump, windmill and straight solar well pumping). We also have one grid-tie system with battery back-up.

Come see for yourself how others are building beautiful yet affordable homes out of non-traditional building materials. At the same time, get an education on how the sun and wind can provide all of your electrical needs.

Limited space is available on this guided tour, so reserve your spot early by calling Susan at Val-U Solar (928) 536-7835.
